

FitMed / MedClear

Digital Medical Fitness Certification Platform — Product Concept & Website Specification

Concept: Secure digital medical fitness assessments conducted and certified by licensed doctors

Prepared as a product concept document

1. Executive Summary

The proposed platform is a digital medical fitness certification service that allows individuals or organizations to request a medical fitness assessment online. Patients create an account, select the purpose of the certificate, complete a structured health questionnaire, provide relevant measurements and health information, and then undergo a secure video consultation with a licensed doctor.

The doctor reviews the application, verifies the patient's identity, performs an appropriate remote clinical assessment, determines whether the patient is fit for the stated purpose, and issues a digitally signed electronic certificate when appropriate.

Artificial intelligence, wearable devices, and digital vital-sign technologies can support screening, data collection, risk flagging, and clinical documentation. However, AI and automated measurements should remain decision-support tools. The final medical fitness decision should be made by the appropriately licensed doctor, and cases requiring physical examination should be referred for in-person assessment.

2. Brand and Naming

2.1 Recommended Names

Name	Positioning
FitMed	Simple, memorable, medical + fitness
MedClear	Medical clearance and verification
MedFit	Direct and easy to understand
CertiMed	Professional certification focus
FitCert	Digital fitness certificate focus
FitClear	Broad clearance platform
HealthCert	Broader, scalable health certification brand

Recommended primary choice: FitMed. Suggested descriptor: “Digital Medical Fitness Certification.”

Recommended alternative: MedClear. Suggested descriptor: “Verified Medical Fitness Certificates.”

2.2 Tagline Options

- FitMed — Your health. Verified.
- MedClear — Medical clearance, made simple.
- FitCert — Verified fitness. Digitally.
- HealthCert — Trusted medical certification, anywhere.

Preferred tagline: “Your health. Verified.”

2.3 Logo Concept

- A modern medical shield combined with a check mark.
- Optional subtle ECG/heartbeat line.
- Digital identity/network element to communicate technology and verification.
- Clean, professional typography.
- Avoid relying on a large traditional red medical cross.

2.4 Color Palette

Role	Recommended direction	Meaning
Primary	Deep navy / blue	Trust, professionalism, medicine, security

Secondary	Teal / green	Health, wellness, technology, positive clearance
Success	Green	Fit / cleared
Warning	Amber	Further review or caution
Danger	Red	Urgent concern / not cleared
Background	Very light gray	Clean clinical interface
Text	Dark navy / charcoal	Readability

3. Core Product Concept

The platform should be positioned as a secure digital medical fitness assessment conducted by a licensed doctor, rather than as an automated certificate generator.

Recommended positioning statement:

“A secure digital medical fitness assessment conducted by a licensed doctor.”

3.1 Key Principle

Fitness is purpose-specific. A person may be fit for an office role but not fit for a high-risk occupation such as working at heights or operating certain machinery. The platform should therefore require the patient to specify the purpose of the certificate before assessment.

4. Patient Journey

1. Create an account and verify phone/email.
2. Provide identity and demographic information.
3. Select “Request Medical Fitness Certificate.”
4. Choose the reason/purpose for the certificate.
5. Complete an adaptive medical history questionnaire.
6. Complete danger-sign and symptom screening.
7. Provide height, weight, and available vital signs.
8. Optionally connect validated wearable or Bluetooth devices.
9. Submit the application.
10. A licensed doctor reviews the application.
11. The doctor initiates a secure live video consultation.
12. The doctor verifies the patient's identity.
13. The doctor completes history taking and an appropriate virtual assessment.
14. The doctor decides: Fit, Fit with Restrictions, Further Assessment Required, or Not Fit.
15. If appropriate, the doctor digitally signs and issues the certificate.
16. The patient receives the certificate and QR verification code.
17. An employer or authorized organization can verify the certificate without accessing unnecessary medical information.

5. Certificate Categories and Eligibility

The platform should use a rules engine so that different certificate purposes have different clinical requirements.

5.1 Potentially Telemedicine-Eligible Categories

- Basic employment or administrative fitness assessments where permitted.
- Some school or university fitness certificates.
- Some general fitness assessments.
- Other low-risk categories approved under the applicable clinical and regulatory framework.

5.2 Categories Requiring Additional Doctor Review

- Significant medical history.
- Abnormal vital signs.
- Concerning symptoms or danger signs.
- Abnormal or inconsistent device measurements.
- Relevant medications or previous hospitalization.
- Any situation where the doctor considers the information insufficient for a fitness decision.

5.3 Potential Physical-Examination-Required Categories

- Certain heavy-machinery occupations.
- Certain work-at-height roles.
- Certain transport/driving assessments.
- Armed/security roles where regulated.
- Aviation-related assessments.
- Diving or other specialized high-risk occupations.
- Any category for which applicable Rwandan law, occupational-health standards, licensing rules, or the doctor requires an in-person examination.

Important: the excluded/high-risk categories should be determined from applicable Rwandan medical, occupational-health, licensing, privacy, and telemedicine requirements. They should not be hard-coded solely from business assumptions.

6. Patient Health Assessment

6.1 Demographic and Identity Information

- Full name
- Date of birth
- Sex
- Phone number
- Email
- Address
- National ID or passport information
- Emergency contact
- Required consent declarations

6.2 Medical History

- Previous illnesses
- Hypertension
- Diabetes
- Cardiovascular disease

- Asthma/COPD
- Epilepsy/seizures
- Relevant mental-health history
- Previous surgery
- Previous hospitalization
- Current medications
- Allergies
- Family history
- Smoking
- Alcohol/substance use where clinically relevant
- Pregnancy status where clinically relevant

The questionnaire should be adaptive. Patients should not be forced to answer a long list of irrelevant questions. Positive responses should trigger targeted follow-up questions.

6.3 Danger-Sign Screening

- Chest pain
- Severe shortness of breath
- Syncope or near-syncope
- Severe headache
- New neurological deficits
- Severe abdominal pain
- Active bleeding
- Seizures
- Severe allergic reaction
- Altered mental status
- Other purpose-specific red flags

A serious red flag should interrupt the certificate pathway and trigger an appropriate medical-care recommendation or clinician review rather than automatic certification.

7. Measurements, AI and Wearables

7.1 Patient Measurements

- Height
- Weight
- BMI
- Temperature
- Heart rate
- Blood pressure
- Respiratory rate
- SpO₂

7.2 AI-Assisted Measurements

The platform may eventually use smartphone camera/computer-vision or remote-PPG technologies to estimate selected physiological parameters. Such outputs should be clearly labeled as AI-estimated or screening measurements unless the specific technology has appropriate validation for clinical use.

The interface should distinguish among: patient-reported measurements, device-measured values, and AI-estimated values.

7.3 Wearable and Device Integration

- Apple Health
- Google Health Connect
- Fitbit
- Garmin
- Samsung Health
- Bluetooth blood-pressure monitors
- Bluetooth pulse oximeters
- Smart scales
- Other validated devices

The platform should display the source, timestamp, and measurement type so that the doctor can judge reliability.

8. Doctor Dashboard

The doctor dashboard is the core clinical workspace.

8.1 Patient Overview

- Patient identity and verification status
- Certificate purpose
- Risk level / screening status
- Medical history summary
- Current medications and allergies
- Vital signs and source
- BMI
- Red flags
- Previous certificates
- Relevant supporting documents

8.2 Consultation

- Secure live video consultation
- Identity verification workflow
- Structured history-taking form
- Purpose-specific clinical checklist
- Virtual examination prompts
- Clinical notes
- Decision support and AI-generated summary
- Digital signature

9. Virtual Clinical Assessment

The doctor may conduct appropriate remote assessments, recognizing that telemedicine cannot reproduce every component of a physical examination.

- General appearance and level of consciousness

- Speech and respiratory effort
- Relevant cardiovascular symptom assessment
- Respiratory symptom and functional assessment
- Orientation and selected neurological assessments
- Gross motor function and coordination where appropriate
- Range of motion and selected musculoskeletal assessments
- Purpose-specific functional tasks where clinically and occupationally appropriate

The system should clearly state that virtual assessment does not replace a physical examination when one is clinically or legally required.

10. Doctor Decision Framework

Decision	Meaning
FIT	Medically fit for the stated purpose.
FIT WITH RESTRICTIONS	Fit subject to clearly documented limitations or restrictions.
FURTHER ASSESSMENT REQUIRED	Requires physical examination, investigation, specialist review, or additional evidence.
NOT FIT	Not medically fit for the stated purpose at the time of assessment.

Using four decision categories is preferable to a simple Fit/Unfit model because it reflects real clinical uncertainty and allows safe escalation.

11. Electronic Medical Fitness Certificate

The certificate should be professionally designed, digitally signed, and verifiable online.

- Platform name and logo
- Certificate title
- Patient name
- Date of birth where appropriate
- Certificate purpose
- Assessment date
- Unique certificate number
- Decision
- Purpose-specific certification statement
- Doctor name
- Professional license number
- Digital signature
- Issue date
- Expiry date where applicable
- QR code
- Online verification code/URL

The certificate should contain only the information necessary for its intended use. Employers should not automatically receive the patient's full medical history.

12. QR Verification System

Every certificate should have a unique certificate number and QR code linked to a public verification page.

Status	Display
Valid	Green / VALID
Expired	Expired
Revoked	Revoked
Cancelled	Cancelled

The public verification page should expose the minimum necessary information, such as certificate validity, issue date, expiry date, purpose, and certificate number. Sensitive clinical history should remain private.

13. Employer / Organization Portal

- Organization account
- Create employee certificate requests
- Send secure request links or invitation codes
- Track pending assessments
- Receive notification when assessment is completed
- Verify certificate status
- Manage multiple employees
- Purchase assessment credits or manage organizational billing

An employer should generally see whether a certificate is valid and whether the person is certified for the stated purpose, rather than seeing diagnoses or detailed clinical information.

14. AI Role and Safety

AI should be designed as a clinical support layer rather than the final decision-maker.

- Screen questionnaires
- Identify possible red flags
- Identify missing information
- Calculate BMI and derived measurements
- Flag abnormal vital signs
- Analyze trends
- Summarize patient history
- Suggest relevant questions to the doctor
- Detect inconsistencies
- Assist with clinical documentation
- Assist with certificate drafting

The final medical fitness decision should remain with an appropriately licensed doctor. AI outputs should be explainable, traceable, and clearly identified as decision support.

15. Doctor Verification and Quality Control

- Doctor name and professional credentials
- Professional license number

- License verification status
- Specialty
- Certificate issuance history
- Consultation history
- Appropriate clinical audit metrics
- Complaint and incident management
- Certificate revocation capability

The system should maintain audit trails so that every certificate can be traced from patient submission through doctor review, identity verification, consultation, decision, signature, and issuance.

16. Administration Dashboard

- Patient management
- Doctor management
- Organization management
- Certificate requests
- Issued certificates
- Payments
- Video consultations
- Audit logs
- Complaints
- Reports and analytics
- Certificate revocation
- Regulatory/compliance monitoring

17. Payment Model

- Patient-paid assessments
- Employer/organization-paid assessments
- Organizational packages or assessment credits
- Different pricing by certificate type and clinical complexity
- Refund/cancellation workflow

Pricing should reflect the clinical service, doctor time, technology costs, and applicable regulatory requirements.

18. Fitness Rules Engine

A central rules engine should determine the assessment pathway based on certificate purpose and clinical information.

- Required history questions
- Required vital signs
- Red flags
- Required examinations
- Telemedicine eligibility
- Triggers for physical assessment
- Required doctor credentials

- Certificate validity period
- Purpose-specific restrictions
- Escalation criteria

This architecture allows the platform to support multiple types of medical fitness assessments without creating a separate product for each category.

19. High-Level Platform Architecture

Recommended workflow:

Patient Web/App → AI Screening Engine → Clinical Assessment Engine → Doctor Dashboard → Secure Video Consultation → Doctor Decision → Electronic Certificate → QR Verification → Patient / Authorized Organization

19.1 Main Platform Components

- Patient web/mobile interface
- Doctor portal
- Organization/employer portal
- Administrator portal
- Authentication and identity management
- Clinical questionnaire engine
- Fitness rules engine
- AI decision-support layer
- Video consultation system
- Electronic certificate generation
- Digital signature system
- QR verification service
- Payment system
- Notification system
- Audit logging
- Secure data storage

20. Recommended MVP

Do not attempt to launch every AI and wearable feature in the first version. The first release should prove the clinical workflow and certificate-verification model.

20.1 Patient MVP

- Account creation
- Identity information
- Certificate request
- Purpose selection
- Adaptive medical questionnaire
- Danger-sign screening
- Vital-sign entry
- Payment
- Video consultation

- Certificate access

20.2 Doctor MVP

- Doctor registration and verification
- Patient queue
- Patient history
- Video consultation
- Structured clinical assessment
- Decision workflow
- Digital signature
- Certificate issuance

20.3 Verification MVP

- Unique certificate number
- QR code
- Public verification page
- Valid/expired/revoked status

20.4 Admin MVP

- Patient management
- Doctor management
- Certificate management
- Payments
- Audit trail

21. Product Roadmap

Phase	Key Features
V1 — MVP	Patient portal, doctor portal, questionnaire, video consultation, digital certificates, QR verification, payments, audit logs
V2	AI screening, AI clinical summaries, wearable/device integrations, employer portal, organization accounts, automated reminders
V3	Mobile apps, APIs, occupational-health integrations, insurance partnerships, advanced clinical decision support, broader regional/international expansion

22. Recommended Homepage Structure

22.1 Hero Section

Headline: “Get your medical fitness certificate online.”

Subheadline: “Verified by a licensed doctor. Secure. Digital. Convenient.”

Primary call-to-action: “Request a Certificate”

22.2 How It Works

18. Request — Tell us why you need your certificate.
19. Complete assessment — Provide your medical history and health information.
20. Consult a doctor — Meet a licensed doctor through secure video consultation.
21. Get certified — Receive a digitally signed certificate with QR verification.

23. Privacy, Security and Regulatory Considerations

Because the platform will process identity information and health information, privacy and security should be built into the architecture from the beginning.

- Strong authentication and session security
- Encryption in transit and at rest
- Role-based access control
- Minimal data disclosure to employers
- Consent management
- Secure document storage
- Audit logs
- Certificate revocation
- Data retention and deletion policies
- Doctor credential verification
- Secure video consultations
- Incident response procedures
- Compliance with applicable Rwandan health, telemedicine, data-protection, electronic-signature, and professional licensing requirements

The legal and clinical framework should be reviewed before launch, particularly for occupational fitness categories, electronic medical certificates, remote physical examination, identity verification, biometric technologies, AI-assisted measurements, and cross-border use.

24. Strategic Positioning

The strongest market position is not “a website that gives medical certificates online.” The stronger proposition is a trusted digital medical fitness assessment platform where licensed clinicians make purpose-specific fitness decisions and every certificate can be independently verified.

Recommended positioning:

“Secure digital medical fitness assessments, conducted by licensed doctors and verified online.”

25. Potential Relationship with MediConnect

Because the product concept is closely related to telemedicine, it could be launched as a specialized vertical or product under MediConnect rather than as a completely unrelated company.

- MediConnect — broader telemedicine and virtual care platform.
- FitMed — specialized medical fitness assessment and certification product.
- Shared doctor network and clinical infrastructure where appropriate.

- Shared video consultation technology.
- Shared identity, payments, notifications, and security infrastructure.
- Separate branding and workflows for employers and certification use cases.

This approach can allow FitMed to develop a focused value proposition while leveraging existing telemedicine capabilities.

26. Recommended Final Concept

Element	Recommendation
Brand	FitMed
Descriptor	Digital Medical Fitness Certification
Tagline	Your health. Verified.
Primary users	Patients, licensed doctors, employers/organizations
Core service	Purpose-specific digital medical fitness assessment
Clinical authority	Licensed doctor
AI role	Screening and decision support, not final certification
Certificate	Digitally signed, purpose-specific, QR-verifiable
Key differentiator	Secure end-to-end assessment + independent verification
MVP priority	Clinical workflow, doctor review, certificate issuance, QR verification

This concept is designed to create a scalable digital certification ecosystem rather than a simple online form. The core trust model is: verified identity → structured assessment → licensed doctor consultation → purpose-specific decision → digitally signed certificate → independent verification.
